

Restful services :-

Enterprise App | Distributed App

B \rightarrow B

Python

WSI \rightarrow Web services Interoperability

B.P.I.O. specification

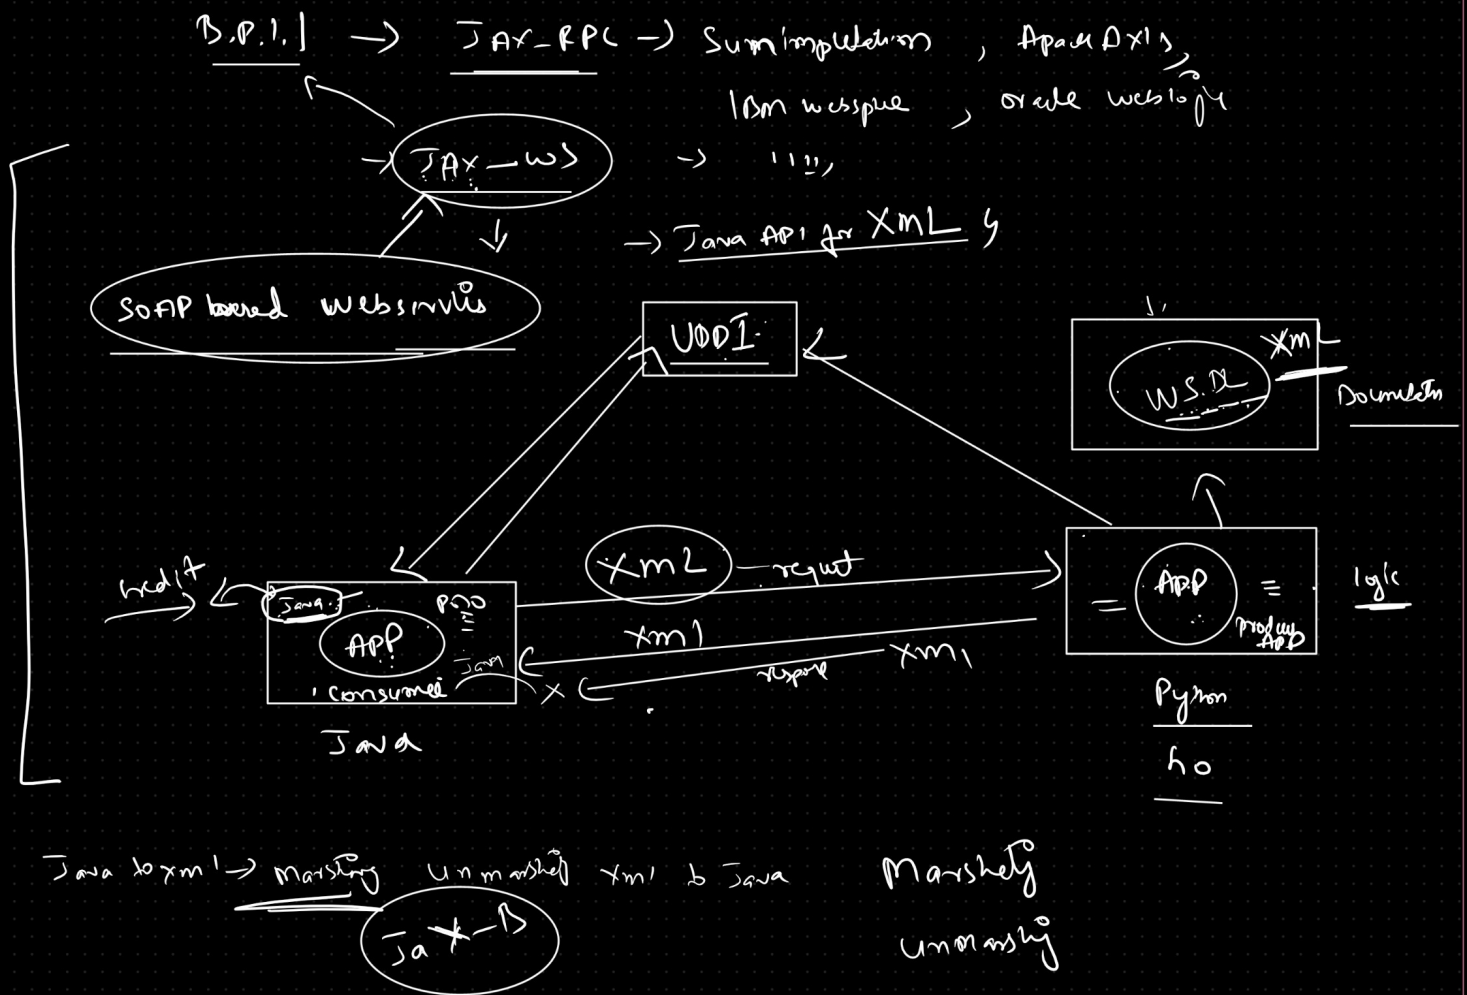

Sum \rightarrow JAX-RPC \Rightarrow API \rightarrow Interoperable

Java API for XML

Java \rightarrow XML \rightarrow Java

Marshalling unmarshalling

=> If we develop a webservice using JAX RPC or JAX WS then that webservices are called SOAP based Webservices

SOAP--> Simple Object Access Protocol

Provider--> Provides business logic or services to other app

Consumer--> Consuming services from another app

--> Contract stands for WSDL

--> WSDL -- Web services Description language

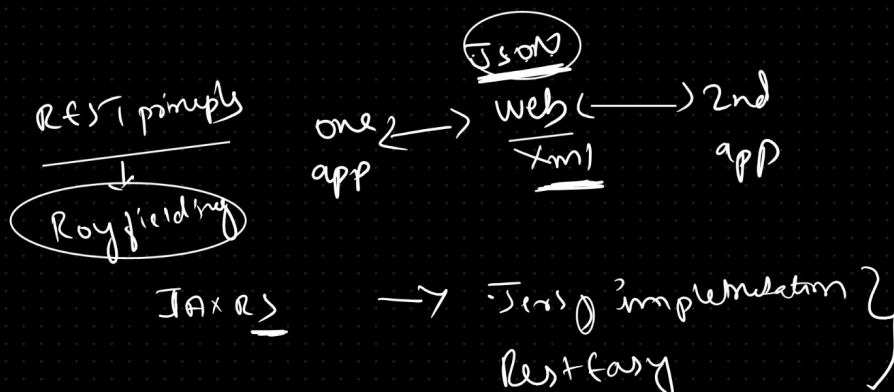

--> WSDL is a special XML which describes how provider is providing business services to consumers

--> ContractFirst--> WSDL file will be created first then the development will be done

--> ContractLast--> Services will be prepared first then the WSDL will be created

Once Provider development is completed, provider will share WSDL file to Consumer through mial, sahrepoint, UDDI (Universal Description Discovery Integration)

SOAP based app will not support JSON and it supports XML

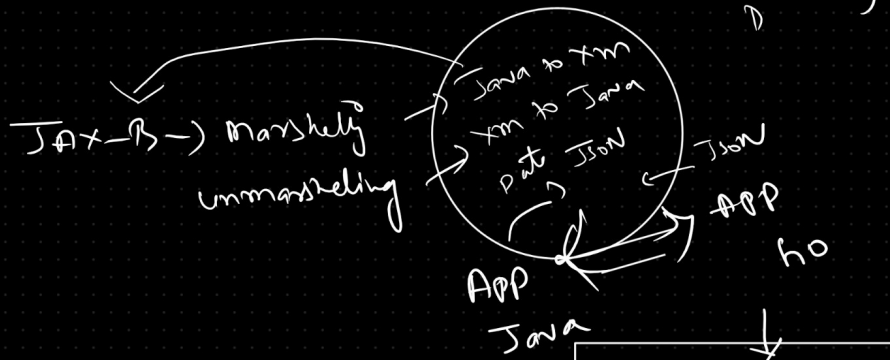

Spring Rest

Rest principle :-

① unique Address → endpoints

JAVA → JSON
 JAVA ← JSON

Jackson API
